

# Accessibility Compliance Review

Post-remediation technical review - 12 September 2026

## Scope and conclusion

This is an engineering accessibility review based on repository evidence and automated tests. It is not a formal WCAG 2.2 AA conformance statement, accessibility certification or substitute for manual assistive-technology testing.

No Critical or High accessibility barrier was confirmed. Remaining risk is assurance depth: automated checks cannot establish complete WCAG conformance, and browser-generated print/PDF output is not controlled as a tagged accessible PDF.

## Merged remediation

PR #469: accessibility baseline expanded to Activities and consent surfaces; missing semantic H1 on /activities fixed.

SW-84 / PR #471: default-theme control contrast fixed. White on #D7263D is about 4.96:1; white on #00853B is about 4.75:1. Jira: Done.

SW-81 / PR #472: WCAG-oriented Playwright regression scanner added for representative public, parent and leader surfaces. Jira: Done.

SW-82 / PR #473: report/generated-document accessibility audit completed. Current reports are HTML/CSV with browser window.print(); no app-owned PDF generator. Jira: Done.

## Automated coverage

Coverage includes document language, main landmark and H1 checks, visible image alt text, accessible names, basic keyboard focus, mobile reflow, duplicate IDs, broken ARIA references, unnamed controls/forms/dialogs, positive tabindex hazards and data-table headers.

## Reports and PDF accessibility

The application cannot guarantee PDF tagging, reading order, document-language metadata or table semantics when a user chooses browser Print to PDF. HTML/CSV remains the accessible source/alternative.

If app-owned PDF generation is introduced later, title/language, selectable text, logical reading order, headings/tables, tagging capability and an accessible alternative must be assessed before release.

## Manual assurance still recommended

Keyboard-only journeys, NVDA/JAWS/VoiceOver testing where practical, validation/error association, zoom/reflow at 200-400%, meaningful image alternatives and manual review of exported documents remain necessary.

Technical accessibility posture: materially improved. There is still insufficient manual and assistive-technology evidence to claim the site is fully accessible or WCAG 2.2 AA conformant.
